**Magnified Tactile Relief Latent Image**

**Better Than Intaglio!**

Like intaglio printing, TamperSafe® also uses a steel engraved die to embed a latent image within the substrate; revealing itself at acute angles and offering a tactile relief for touch verification. In the case of a Vital Record, the latent image would typically be a 'V' on the left side and an 'R' on the right side.

The TamperSafe® process applies a heat released holographic laminate under high pressure and is impossible to remove without destroying the substrate. This multi-imaged optically variable laminate can either be non metallic and transparent, protecting an image underneath, or can be composed of metallic and highly reflective holographic images.

Applied to high security Vital Records, Certificates of Title, or Certificates of Origin, TamperSafe® is more cost effective and is a superior alternative to intaglio printing.

**SECURE BY DESIGN**
